Foreword

This study of labor income was prepared by Miss Dorothy E. Smith of the Statistics Section, Dr. Theodore Kreps and Mr. William Maguire in charge. ^{1/} Grateful acknowledgement is made to Dr. Robert Nathan of the Bureau of Foreign and Domestic Commerce for valuable suggestions and criticisms. Dr. Nathan's annual estimates of labor income paid out were used as the bases for the monthly labor income estimated in this study.

Labor income comprises total wages, salaries, commissions, pensions, workmen's compensations, and compensation of corporation officers paid out in continental United States. The inclusion of compensation of corporation officers in labor income is somewhat misleading because the principal corporate officers perform entrepreneurial functions and are entrepreneurs in all but the title. However, the segregation of this group is impossible with the data which are at present available.

The study of labor income represents an attempt to break down total labor income paid out into two groups, first, those industries which came under Title I of the National Industrial Recovery Act, and, second, those fields of activity which were excluded from the jurisdiction of NRA, namely, agriculture, steam railroads, government, professional and domestic service.

The following items are entirely excluded: consideration of services of housewives and other members of the family in the home, earnings from odd jobs, direct relief and charity payments, and earnings from illegal pursuits. Work relief wages are excluded from the total labor income figure, except in Table V.

^{1/} Acknowledgement is made to the entire staff of the Current Statistics Unit, especially to Dr. Gertrude Working for valuable assistance throughout the study.

The data available for labor income estimates are more abundant and reliable than for any other type of payment group. But even then, the data are far from adequate in many of the fields, especially in the construction, water transportation, motor transportation, finance, service, government, and miscellaneous groups. A more complete explanation of the shortcomings of the data is given in the description of the Sources.

Labor income represents approximately two-thirds of the total income paid out. The following figures taken from the annual estimates of National Income by Mr. Nathan, of the Bureau of Foreign and Domestic Commerce, show the relative importance of labor income each year:

Percentage Distribution of Income Paid Out,
by Types of Payment, 1929-1934

Year	Per Cent Total Income	Per Cent Labor Income	Per Cent Non-Labor Income
1929	100.0	65.0	35.0
1930	100.0	64.2	35.8
1931	100.0	64.2	35.8
1932	100.0	63.9	36.1
1933	100.0	65.5	34.5
1934	100.0	67.0	33.0

Quarterly estimates of non-labor income, comprising property income and entrepreneurial withdrawals, are in process, and it is hoped that soon they will be completed and made public under other auspices.

At the back of this report will be found a brief statement of the studies undertaken by the Division of Review.

SOURCES AND METHODS OF MONTHLY ESTIMATES
OF LABOR INCOME, 1929 TO DATE

I. General Method

The annual estimates of labor income paid out for 1929 through 1934, made by Mr. Robert Nathan, Chief of the Income Section, Division of Economic Research, Bureau of Foreign and Domestic Commerce, have been broken down into monthly figures by correlating the various items with the appropriate annual totals of certain monthly series used as bases and assuming that the correlation established for the annual totals would likewise hold true for each month. Current months have been estimated from the relationship established by this correlation, computed for the annual totals of the years 1929 through 1934.

The three following requirements determined the selection of the monthly series used as bases. First, there must be a logical relationship between the monthly base series and Nathan's annual income estimates. In the majority of cases a sample payroll series of the same industry was used; where these data were not available, either an index of business activity for that particular industry or the labor income paid out for other related industries was used as the basic series. Second, the monthly series must have a seasonal variation which would reflect as accurately as possible the seasonal variation in the annual group labor income. Third, the monthly series, having satisfied the above requirements, must show as high a coefficient of correlation as possible with Nathan's annual estimates. In some cases it was necessary to consider interacting factors rather than rely on a given series.

The monthly figures were computed from the correlation equation and the yearly sum of these computed figures compared with Nathan's estimates. Bias was apportioned over the respective months as indicated by plotting the residuals and estimating their curve.

In most cases where there was any appreciable difference between the computed annual total and Nathan's annual estimate, the computed figure was slightly greater than Nathan's figure for 1929, 1933 and 1934, and slightly less than Nathan's for 1930, 1931 and 1932; but in a few cases where the correlation was otherwise almost perfect, the 1934 computed figure was slightly less than Nathan's figure. The bias was presumably due, in part, to the fact that the bases were chiefly samples which involved the following limitations: first, they were samples of payrolls of the more efficiently organized concerns which reacted to general business conditions more rapidly and were therefore relatively higher than the average concern in recovery years, and relatively lower in depression years; second, they were samples of payrolls of a relatively constant number of concerns without proper provision for new concerns entering the field and old ones dropping out; and, third, for recent years they were preliminary samples of payrolls and therefore subject to revision.

II. Component Parts of Labor Income

A. MANUFACTURING

The basic series were the weekly wage payroll figures, adjusted to a monthly basis, of all manufacturing industries minus railroad-repair shops, as reported in the Trend of Employment, published by the Bureau of Labor Statistics. Railroad-repair shops were subtracted here because they are later covered in the steam-railroad group. Nathan's estimates were broken down into (a) wages and other compensation, which were correlated directly with the Bureau of Labor Statistics wage payroll figures, and, (b) salaries, which, for lack of better information, ^{1/} we assumed varied as wages and therefore were correlated with the Bureau of Labor Statistics wage payroll figures after applying a 12-months' trailing average. This last step was considered advisable to allow for the lag in salaries compared with wage payrolls, and also for the fact that salaries are not so subject to seasonal variation as wages.

^{1/} The Bureau of Labor Statistics has received information on salaries from the same concerns which report wages since July, 1934, but no tabulation of the salary data has been made, nor any decision been reached concerning the handling of these data.

B. MINING

The basic series was composed of the sum of the indexes for anthracite mining, bituminous-coal mining, metalliferous mining, quarrying and non-metallic mining, and crude-petroleum producing, after having weighted each by its total payroll in 1929, as reported in the Census of Mines and Quarries. The indexes used were those reported in the Trend of Employment, published by the Bureau of Labor Statistics. These series were started in 1929 and the figures for the first year are not as reliable as those covering other years when the data were more representative.

C. CONSTRUCTION

1. Contract Building Construction Valued at More Than \$5,000

Labor income paid out for contract building construction valued at more than \$5,000 was computed by obtaining the per cent labor cost is of total cost from the ratio of the index of estimated total cost of construction per square foot to the index of average monthly wage rates and weighting the result by the per cent labor cost was of total cost in 1929. This per cent labor cost is of total cost was applied to the total F.W. Dodge's building construction value corrected to include the eleven western states, and after an allowance was made for the duration of work. A more detailed description of this method is given below.

Index of Estimated Total Cost of Construction per Square Foot. - From the F. W. Dodge Corporation's monthly reports for contracts awarded in 37 eastern states, the total cost per square foot was computed for each month by dividing the total value by the total floor space. This procedure was followed for each of the 4 groups, (1) 1 and 2 family houses which included "Dwellings, Owners," "Dwellings, Sale or Rent," and "2 Family Dwellings"; (2) Apartment Houses which included "Apartments," "Dormitories," and "Hotels"; (3) Commercial Buildings which included "Commercial Buildings," and "Factories"; and (4) Public Buildings which included "Educational Buildings," "Hospitals and Institutions," "Public Buildings," "Religious and Memorial Buildings," and "Social and Recreational Buildings,"

The data on cost per square foot were then made into a series of index numbers, 1929 to date, by months, with the average for 1929=100.

Index of Average Monthly Wage Rates, by Months. - The weighted average wage rate for skilled and unskilled labor as reported by the Engineering News Record was made into an index, 1929 to date, by months, with the average for 1929=100. 1/

Per Cent Labor Cost is of Total Cost, by Months. - The index of estimated cost per square foot was divided by the index of average monthly wage rates in order to obtain the real changes in wage rates by eliminating the effect of the change in total construction costs since 1929. This corrected index was then weighted by the percentage which wages were of total costs as reported in 1929 by establishments doing an annual business of \$25,000 or more. Total construction costs for this group were obtained by subtracting "subcontract work let" from the total value of construction business to give a net figure for the construction work done. The data on total costs and wages in 1929 were compiled from the Census report on the Construction Industry. 2/

Total Building Contract Construction Costs for Projects Valued at more than \$5,000 in the United States, by Months. -

Total cost each month was computed by increasing the Dodge total value to include the 11 Western States not covered by the Dodge reports, as follows: the per cent which building permits for residential and non-residential buildings in the 11 Western States were of total permits reported in the Bureau of Labor Statistics publication, Building Construction, was computed and plotted on a graph for each month from 1929 to date. The general trends of the percentages were estimated by a gradation formula. 3/

-
- 1/ The Engineering News Record wage reports cover 20 cities and the skilled figure represents bricklayers, carpenters, and iron workers.
- 2/ The Construction Census coverage is not sufficiently adequate to use for any totals, but the ratio of costs used here appears to be satisfactory.
- 3/ The NRA is preparing a detailed study of the value of construction in the 11 Western States, which will probably be used when it becomes available.

Allowance for Duration of Construction Work. - The duration of construction work for 1 and 2 Family Houses, Apartments, Commercial Buildings, and Public Buildings, was computed from the frequency tables showing the "Number of Days Between Commencement of Excavations and Completion of Building," as published by the Bureau of Labor Statistics in the Monthly Labor Review of January, 1933. The time interval in which fell the median of the number of buildings, weighted by the average cost in each cost group, was selected as the duration of construction for each group of buildings. In each group the mode fell in approximately the same time interval as the median except for Public Buildings, where the large cost of a few buildings tended to exaggerate slightly the amount of buildings taking over a year to build.

Allowance for the duration of construction work was made by taking a trailing average covering the average number of months required to complete the buildings in the respective groups.

Computation of Actual Labor Cost. - The actual amount of the labor cost was computed by applying the above derived labor-cost percentage (see p. 4) each month to the total building contract construction cost for projects valued at more than \$5,000, adjusted to cover the entire United States and including an allowance for the lapse of time between the awarding of the contract and the completion of the project.

2. Non-Building, Publicly financed Construction

Beginning early in 1934, the Bureau of Labor Statistics reported the payrolls on construction projects financed by the P.W.A., the R.F.C., and the regular Federal appropriations. ^{1/}

^{1/} Payrolls on construction projects financed from regular Federal government appropriations are incomplete because they do not include payrolls on projects awarded prior to July, 1934, when collection of this information began.

It was assumed that one-half of the non-building publicly financed construction projects were done by force work.^{1/} The remaining one-half of the total reported payrolls for Highways, ^{2/} Water and Sewerage, Bridges, Railroad

^{1/} A rough estimate of the amount of force work done in 1934 was made by taking the sum of the total wages on all types of construction projects for which such data were available, namely, the publicly financed construction payrolls (excluding building construction and naval vessels) reported by the Bureau of Labor Statistics, plus the computed contract building wages on projects over \$5,000 and the computed wages on all projects under \$5,000, and subtracting Nathan's estimate of wages on contract construction. The remainder should approximately represent the amount of wages paid for force work in 1934, and practically equals one-half of the total wages on publicly financed construction payrolls (excluding building construction and naval vessels) reported by the Bureau of Labor Statistics, plus the computed wages on all projects under \$5,000.

In order to break the annual total down into monthly figures and also to project the series into 1935, one-half of the sum of the publicly financed construction payrolls (excluding building construction and naval vessels) reported by the Bureau of Labor Statistics, plus the computed wages on all projects under \$5,000, was taken each month in order to obtain monthly estimates of payrolls on all force work -- both public and private. The estimate for force work was not included in the total labor income estimates because a large portion of this force work was included in other industries, chiefly transportation, communications, manufacturing, mining, and government.

^{2/} The Bureau of Public Roads reports employment beginning in 1931, but a comparison shows that payrolls do not closely follow the trend of employment.

Construction, and River, Harbor, and Flood Control ^{1/} was added to the total contract building wages each month of 1934 and 1935 to give the total contract construction wages.

3. Construction Volume Under \$5,000

Monthly interpolations were made of the Dodge annual estimates of construction volume under \$5,000 on the basis of monthly fluctuations in the Dodge "Total Building Construction over \$5,000 in 37 Eastern States" and the "Total Amount of Additions, Alterations, and Repairs in 792 Cities," ^{2/} as reported by the Bureau of Labor Statistics in Building Construction.

Construction under \$5,000 comprises for the most part small one-family houses, farm construction, and repairs and alterations, for which the per cent of labor cost to total construction cost is greater than for large buildings. This is due to the fact that more of the work has to be performed by manual labor than is the case on big jobs where machinery is more extensively used; and to the fact that the material used on small jobs is proportionately less expensive -- for example, the rare marbles and steel framework in a large office or public building are proportionately much more expensive than the paint and lumber used to remodel a rococo house or build a garage.

^{1/} Building construction as reported financed by P.W.A., R.F.C., and regular Government appropriations was not included due to the duplication which it would involve, because publicly financed building construction was included in the estimates based on the F. W. Dodge Corporation reports (see p. 3). Forestry, naval vessels, reclamation, and miscellaneous were also omitted because in general they were reported in manufacturing or involve more force work than contract work. The reported payrolls on publicly financed non-building construction projects contain some payrolls which were duplicated in the government payrolls reported by the Civil Service Commission and other Government agencies.

^{2/} The total amount of additions, alterations, and repairs in April, 1935, covered 792 cities; other months were computed from the link relative.

For lack of better information, it was arbitrarily assumed that the labor cost on projects under \$5,000 is 50 per cent of the total cost. This 50 per cent was arrived at by adding 10 per cent to the more or less standard 40 per cent labor cost. ^{1/} This per cent of labor cost was applied to the total construction cost for projects under \$5,000 after an adjustment was made for the lapse of time between the starting and completion of work based on the average length of time to complete a house or store valued at less than \$5,000, as indicated in the frequency tables showing "Number of Days Between Commencement of Excavations and Completion of Building," published by the Bureau of Labor Statistics in the Monthly Labor Review of January, 1933.

4. Nathan's Annual Construction Wages Broken Down by Months According to Variations in the Computed Wages for Construction

The total computed wages paid on building contract construction projects valued at more than \$5,000 plus construction projects valued at less than \$5,000 were used as the basic series to break down Nathan's annual wage figures after adjusting the computed wages for 1934 and 1935 to include non-building publicly financed construction projects. ^{2/} It should be noted that the two series are not strictly comparable because: (1) Nathan's data cover all contract construction, while that part of the computed series which related to construction valued at more than \$5,000 includes only building construction for the years 1929 through 1933; and (2) Nathan's data include nothing but contract construction, while the computed series, since it covers all construction under \$5,000, includes some force work. As indicated, the computed series excludes public works prior to 1934, while Nathan's includes contract public works for every year.

^{1/} 40 per cent labor cost is used by the Associated General Contractors of America in their construction cost index, and by Mr. von Szeliski in his income estimate for construction.

^{2/} The sum of the total contract building wages plus the non-building publicly financed construction wages for each month was weighted by the ratio of the total annual contract building wages to the total annual contract building wages plus one-half of the annual non-building publicly financed construction contract wages in order to maintain a correlation base similar to previous years.

5. Construction Salaries

For lack of better information, it has to be assumed that salaries tend to vary as total volume of building contracts over \$5,000. However, salaries do not follow the wide seasonal variation shown in volume of business, and this situation was provided for by taking a 12-months' moving average of the Dodge figures on total awards of building contracts of more than \$5,000. Current months were estimated in the moving average by computing the seasonal factor and correcting according to the proportional amount of the missing months determined by the seasonal factor. The volume of building contracts over \$5,000 was chosen as the basic series because that is practically the only construction group which would be done by companies requiring any appreciable number of salaried employees.

D. TRANSPORTATION INDUSTRIES WITHIN NRA SCOPE

1. Water Transportation

The basic series was the sum of the water transportation traffic tonnage as reported by the Bureau of Foreign and Domestic Commerce, the War Department, and the New York State Superintendent of Public Works, in the Survey of Current Business.^{1/} This included the traffic on the Cape Cod Canal, New York State Canal, U. S. vessels in the Panama Canal, and U. S. vessels in the Sault Ste. Marie Canal.^{2/} The traffic on the Suez Canal was omitted because the U. S. tonnage there has been included in the Ocean Traffic group listed below. The St. Laurence Canal traffic and the Welland Canal traffic have been omitted because of their Canadian situation and the fact that their traffic is partially included either in the Sault Ste. Marie or the New York State Canal group, and, moreover, its inclusion would give too much weight to the Great Lakes traffic. The Mississippi River government barges, the traffic on the Allegheny, Monongehela, and Ohio Rivers, and the ship clearances of U. S. vessels in Ocean traffic were also included.

^{1/} A weighting of the traffic tonnage figures based on the average annual labor income on the Great Lakes, inland waterways, and foreign and coastwise water transportation might have given slightly more accurate results, but the method of estimating labor income from tonnage figures is not sufficiently accurate to warrant too complicated calculations.

^{2/} In order to confine the data to U. S. vessels, the percentage that these are of the total in the Sault Ste. Marie Canal was estimated from data in the Report of the Chief of Engineers, U. S. Army, 1933, Waterborne Commerce of the United States, Part II, Commercial Statistics.

2. Electric Railroad and Motor Bus Transportation

The basic series was the payroll series for electric-railroad and motor bus operation and maintenance as reported in the Trend of Employment by the Bureau of Labor Statistics. This series excludes motor trucking and motor buses not affiliated with street railways, which are included in Nathan's estimate for this group; also, it was started in 1929 and the figures for the first year are not as reliable as those covering other years when the data were more representative.

3. Pipeline Transportation

The basic series was the crude petroleum consumption (run to stills) as reported by the Bureau of Mines in the Survey of Current Business. ^{1/}

4. Airplane Transportation

The basic series was the airplane travel -- i.e., the number of passenger miles flown -- as reported in the Survey of Current Business and covering the scheduled airlines operating in the United States. ^{1/} This series was first reported in July, 1931. Monthly figures prior to this date were estimated by extrapolation, using the monthly average of Nathan's annual figures as a guide to show the changes in trend.

The monthly labor income for water, pipeline, and air transportation, which was based on data published in the Survey of Current Business, was corrected for the varying length of the month. This correction was not necessary for Electric Railroad and Motor Bus Transportation labor income because all of the Bureau of Labor Statistics series are based on the payroll for a given week in each month, and the only adjustment necessary was a weighting for the average number of weeks in a month.

E. COMMUNICATION

The basic series was the telephone and telegraph payroll index as reported by the Bureau of Labor Statistics in the Trend of Employment. This series was started in 1929 and the figures for the first year are not as reliable as those covering other years when the data were more representative.

^{1/} The figures for labor income paid out in Pipeline and Airplane Transportation were so small in amount that only general trends were capable of being distinguished.

F. RETAIL TRADE

The basic series was the total retail trade payroll index as reported by the Bureau of Labor Statistics in the Trend of Employment. ^{1/}

G. WHOLESALE TRADE

The basic series was the total wholesale trade payroll index as reported by the Bureau of Labor Statistics in the Trend of Employment. ^{1/}

H. BANKING

The total salaries and wages paid semi-annually to Federal Reserve Member Bank employees, as published in the Federal Reserve Board Bulletin, was used as a sample series to break down Nathan's annual labor income.

The basic series correlated with these semi-annual figures for 1929, 1930 and 1931 ^{2/} was a weighted average index composed of loans and investments for 101 cities, as reported in the Federal Reserve Board Bulletin, changed to an index with 1929=100, and weighted by the per cent that commercial banks are of total banks each year; and time deposits, as reported in the Federal Reserve Bulletin, changed to an index with 1929=100, and weighted by the per cent that savings banks are of total banks each year. The per cent that commercial and savings banks are of total banks was estimated from data in the Annual Reports of the Comptroller of the Currency.

The basic series correlated with the semi-annual figures for 1932, 1933 and 1934 was the unpublished confidential bank payroll series of the Bureau of Labor Statistics. ^{3/}

^{1/} The indexes for wholesale and retail trade were revised in the latter part of 1934 to conform with the trends shown by the 1929 and 1933 Census averages.

^{2/} This basic series is the only one in the Labor Income study whose coefficient of correlation has a probability greater than .01, and the probability here is .05, indicating that there would be 5 chances in 100 of getting a correlation as good as this due to chance alone. Twenty-five series and combinations of series were tested and the series used here appeared to be the most satisfactory.

^{3/} This series has a rather poor coverage, but it is reported that in the near future the Federal Deposit Insurance Corporation will take over this series and increase its coverage immensely.

I. REAL ESTATE

The basic series were the National Industrial Conference Board's rent index and the real estate activity index published in the Real Estate Analyst. The National Industrial Conference Board's rent index covers approximately 173 cities of more than 25,000 population, widely distributed geographically. The rents are based on the following specifications, "approximate average monthly rent for a house or apartment of 4 or 5 rooms with bath, heat not furnished by landlord, such as is usually occupied by a wage earner." ^{1/}

The real estate activity index is based on the relationship of the number of families to the voluntary sales of real estate in 24 principal cities and their suburban communities, comprising in all 175 cities of more than 5,000 population. This series, as published, is a preliminary series subject to the following objections: (1) that there are not enough Southern cities, and (2) that it is impossible in some instances to separate voluntary sales from voluntary ones, and (3) other complicating factors such as the fact that in one community cemetery lots are recorded by warranty deeds and can not be separated from ordinary real estate transactions. The real estate activity series, as reported in the Real Estate Analyst, is seasonally adjusted according to the number of voluntary transfers and the number of new deeds recorded, and the same seasonal factors were used to unadjust the series.

J. INSURANCE

The 1930 and 1931 yearly indexes were interpolated in the Bureau of Labor Statistics unpublished confidential series on insurance payrolls by correlation with Nathan's annual estimates of insurance labor income. The seasonal factor was computed from the Bureau of Labor Statistics unpublished confidential insurance monthly payroll series for 1932, 1933, 1934 and the first four months of 1935, and applied to the computed annual index for 1930 and 1931 and the base index for the year 1929. The computed series combined with the Bureau of Labor Statistics series was used as a base.

^{1/} National Industrial Conference Board, The Cost of Living in the United States, 1914-1930, pp. 57-59.

K. ELECTRIC LIGHT AND POWER AND GAS

The basic series was the electric light and power and manufactured gas payroll index as reported by the Bureau of Labor Statistics in the Trend of Employment. This series was started in 1929 and the figures for the first year are not as reliable as those covering other years when the data were more representative.

L. PERSONAL SERVICES 1/

The basic series were the Bureau of Labor Statistics payroll indexes for hotels, 2/ laundries, and dyeing and cleaning 3/ as reported in the Trend of Employment, and weighted by the payroll for hotels as reported in the Census of Hotels and the payroll for laundries and cleaning and dyeing establishments as reported in the 1929 Census of Manufactures. The 1929 and 1930 payroll series for laundries and dyeing and cleaning were estimated by determining the seasonal factor from the given years 1931-1935 and applying this factor to the base index for 1929 and to the 1930 index computed by correlation with Nathan's annual estimates of Personal Service.

M. BUSINESS SERVICE 4/

The basic series was the trade plus finance labor income as computed above.

N. MISCELLANEOUS SERVICE 5/

The basic series was the trade labor income as computed above.

1/ Includes hotels, power laundries, cleaning and dyeing establishments, and beauty and barber shops.

2/ Basic series covers only hotels operating on a 12-month basis.

3/ Basic series excludes hand laundries and small cleaners.

4/ Includes independent private practice accounting, trade associations, and chambers of commerce.

5/ Includes photography, undertaking and cemetery operation, social service and welfare agencies, and athletic and country clubs.

O. AMUSEMENTS 1/ AND MISCELLANEOUS 2/

The basic series was composed of the sum of all the monthly labor income series computed above plus steam railway, government and agriculture labor income, and also plus agricultural entrepreneurial withdrawals. 3/ The basic series used for agricultural entrepreneurial income was cash income from farm marketings, as published by the Bureau of Agricultural Economics. The monthly agriculture figures were corrected for the varying length of the months.

P. AGRICULTURE

The basic series was an index of hired farm wages computed by weighting the hired employees per crop reporting farm, adjusted to represent all farms, by the farm wage rate without board per month. All of the above mentioned data were supplied by the Bureau of Agricultural Economics. The total hired farm labor income was adjusted for the varying length of the months.

Q. STEAM RAILWAYS (INCLUDING PULLMAN AND EXPRESS)

The basic series for steam railways and pullman companies was the total compensation of all employees as published in Wage Statistics, Class I Steam Railways in the United States, 4/ by the Interstate Commerce Commission.

- 1/ Includes theatres, motion picture production, radio broadcasting, bowling alleys, etc.
- 2/ Includes fishing and harbor craft, hand trades, water companies, other public utility and finance not listed under main groups, and "nature of business not given" industries.
- 3/ When total property income and entrepreneurial withdrawals have been computed, they probably should be used also in the basic series. (See foreword.)
- 4/ These reports include switching and terminal companies. The same number of companies are not covered each month, but the figures are comparable because the changes are due to leasings and consolidations.

The basic series for 1929 through 1933 for express companies was the compensation of professional, clerical, and general employees ^{1/} reported in Wage Statistics, Class I Steam Railways in the United States, published by the Interstate Commerce Commission. The basic series for 1934 and 1935 were the unpublished Interstate Commerce Commission series on total compensation of Pullman and Express Company employees.

The monthly figures were corrected for the varying length of the months.

R. PROFESSIONAL AND DOMESTIC SERVICE

The basic series was composed of the sum of all the monthly labor income series computed above plus steam railway, government and agriculture labor income, and also plus agricultural entrepreneurial withdrawals. (See p. 14.)

S. FEDERAL SERVICE

1. Salaries

The monthly averages of Nathan's annual figures were graphed and monthly figures interpolated for 1929, 1930, 1931, 1932 and 1933, based on a graphical analysis. For 1934 and 1935 the Bureau of Labor Statistics payroll series for the United States Government, as published in the Trend of Employment, was used, after adjusting for the slight difference between Nathan's total federal salaries and the Bureau of Labor Statistics total reported federal payroll.

2. Pensions

The monthly averages of Nathan's yearly figures were graphed and monthly figures interpolated for 1929, 1930, 1931 and the first 6 months of 1932, based on a graphical analysis. The expenses of the Veterans' Administration, ^{2/} as reported in the Annual Reports of the Secretary of the Treasury on the State of the Finances and the Daily Treasury Statement, published by the Treasury Department, were used as the basic series for 1932, 1933 and 1934, and correlated with Nathan's Pensions.

T. STATE AND LOCAL

1. State, City, and County

The monthly averages of Nathan's annual figures for State, City, and County labor incomes were graphed and the monthly

^{1/} Approximately 80 per cent of this group are clerks.

^{2/} The Treasury reports pensions only on a yearly basis.

figures interpolated for 1929, 1930, 1931, 1932, 1933 and 1934, based on the cycle trend. 1935 figures were computed by using Federal Salaries and Pensions as a base and correlating with Nathan's annual figures representing the sum of State, City and County labor income.

2. Public Education ^{1/}

The percentage of the various size cities falling in each frequency group of the number of months over which teachers' salary payments extend, as reported by the National Education Association in their Research Bulletin, Vol. 10, No. 2, was weighted by the total salary payments for teachers and principals in the respective city groups, as reported in Statistics of City School Systems, published by the Interior Department. The period distribution of rural school teachers' salaries was estimated from the ratio of the average length of urban school terms to the average length of rural school terms, obtained from data in the Statistics of State School Systems, published by the Interior Department, and applied to the total annual rural school teachers' salaries as reported in the same publication. The trend towards shorter pay periods in smaller communities as reported by the National Education Association Bulletin, mentioned above, was also used in determining the estimate of the length of rural schools pay periods. The salaries of the faculty of publicly financed Colleges and Universities, as reported by the Interior Department in Statistics of Higher Education, were assumed to be equally distributed between the 10 months pay-period and the 12 months pay-period. The per cent of the total of the urban and rural school salaries and the University and College faculty salaries paid each month was computed and applied as a seasonal factor to Nathan's total public education labor income. Necessary bias adjustments were made to maintain the same salaries throughout each academic year.

The 1935 salaries were estimated from the data on the status of salary schedule operation in 203 cities, as reported in News Bulletin No. 3, issued October 15, 1935, by the National Education Association.

^{1/} Private education salaries are included under Professional Service.

Sources: Estimated from data taken from publications of the Bureau of Agricultural Economics; Bureau of Foreign and Domestic Commerce; Federal Reserve Board; Interstate Commerce Commission; Bureau of Labor Statistics; Treasury Department; War Department; F. W. Dodge Corporation; National Education Association; National Industrial Conference Board; and the Real Estate Analyst Company. A few of the base series are from unpublished material. For further information, see above, "Sources and Methods," p. 13-15.

- a/ Includes hotels, power laundries, cleaning and dyeing establishments, and beauty and barber shops.
- b/ Includes theatres, motion picture production, radio broadcasting, bowling alleys, etc.
- c/ Includes independent private accounting businesses, Trade Associations, and Chambers of Commerce.
- d/ Includes photography, undertaking and cemetery operation, social service and welfare agencies, and athletic and country clubs.
- e/ 1933 and 1934 figures are based on preliminary annual estimates. 1935 figures are preliminary and subject to revision when data for the complete year become available.

THE DIVISION OF REVIEW

THE WORK OF THE DIVISION OF REVIEW

Executive Order No. 7075, dated June 15, 1935, established the Division of Review of the National Recovery Administration. The pertinent part of the Executive Order reads thus:

The Division of Review shall assemble, analyze, and report upon the statistical information and records of experience of the operations of the various trades and industries heretofore subject to codes of fair competition, shall study the effects of such codes upon trade, industrial and labor conditions in general, and other related matters, shall make available for the protection and promotion of the public interest an adequate review of the effects of the Administration of Title I of the National Industrial Recovery Act, and the principles and policies put into effect thereunder, and shall otherwise aid the President in carrying out his functions under the said Title. I hereby appoint Leon C. Marshall, Director of the Division of Review.

The study sections set up in the Division of Review covered these areas: industry studies, foreign trade studies, labor studies, trade practice studies, statistical studies, legal studies, administration studies, miscellaneous studies, and the writing of code histories. The materials which were produced by these sections are indicated below.

Except for the Code Histories, all items mentioned below are scheduled to be in mimeographed form by April 1, 1936.

THE CODE HISTORIES

The Code Histories are documented accounts of the formation and administration of the codes. They contain the definition of the industry and the principal products thereof; the classes of members in the industry; the history of code formation including an account of the sponsoring organizations, the conferences, negotiations and hearings which were held, and the activities in connection with obtaining approval of the code; the history of the administration of the code, covering the organization and operation of the code authority, the difficulties encountered in administration, the extent of compliance or non-compliance, and the general success or lack of success of the code; and an analysis of the operation of code provisions dealing with wages, hours, trade practices, and other provisions. These and other matters are canvassed not only in terms of the materials to be found in the files, but also in terms of the experiences of the deputies and others concerned with code formation and administration.

The Code Histories, (including histories of certain NRA units or agencies) are not mimeographed. They are to be turned over to the Department of Commerce in typewritten form. All told, approximately eight hundred and fifty (850) histories will be completed. This number includes all of the approved codes and some of the unapproved codes. (In Work Materials No. 18, Contents of Code Histories, will be found the outline which governed the preparation of Code Histories.)

(In the case of all approved codes and also in the case of some codes not carried to final approval, there are in NRA files further materials on industries. Particularly worthy of mention are the Volumes I, II and III which constitute the material officially submitted to the President in support of the recommendation for approval of each code. These volumes 9768--1.

set forth the origination of the codes, the sponsoring group, the evidence advanced to support the proposal, the report of the Division of Research and Planning on the industry, the recommendations of the various Advisory Boards, certain types of official correspondence, the transcript of the formal hearing, and other pertinent matter. There is also much official information relating to amendments, interpretations, exemptions, and other rulings. The materials mentioned in this paragraph were of course not a part of the work of the Division of Review.)

THE WORK MATERIALS SERIES

In the work of the Division of Review a considerable number of studies and compilations of data (other than those noted below in the Evidence Studies Series and the Statistical Material Series) have been made. These are listed below, grouped according to the character of the material. (In Work Materials No. 17, Tentative Outlines and Summaries of Studies in Process, the materials are fully described).

Industry Studies

Automobile Industry, An Economic Survey of
Bituminous Coal Industry under Free Competition and Code Regulation, Economic Survey of
Electrical Manufacturing Industry, The
Fertilizer Industry, The
Fishery Industry and the Fishery Codes
Fishermen and Fishing Craft, Earnings of
Foreign Trade under the National Industrial Recovery Act
Part A - Competitive Position of the United States in International Trade 1927-29 through 1934.
Part B - Section 3 (e) of NIRA and its administration.
Part C - Imports and Importing under NRA Codes.
Part D - Exports and Exporting under NRA Codes.
Forest Products Industries, Foreign Trade Study of the
Iron and Steel Industry, The
Knitting Industries, The
Leather and Shoe Industries, The
Lumber and Timber Products Industry, Economic Problems of the
Men's Clothing Industry, The
Millinery Industry, The
Motion Picture Industry, The
Migration of Industry, The: The Shift of Twenty-Five Needle Trades From New York State, 1926 to 1934
National Labor Income by Months, 1929-35
Paper Industry, The
Production, Prices, Employment and Payrolls in Industry, Agriculture and Railway Transportation, January 1923, to date
Retail Trades Study, The
Rubber Industry Study, The
Textile Industry in the United Kingdom, France, Germany, Italy, and Japan
Textile Yarns and Fabrics
Tobacco Industry, The
Wholesale Trades Study, The
Women's Neckwear and Scarf Industry, Financial and Labor Data on

Women's Apparel Industry, Some Aspects of the

Trade Practice Studies

Commodities, Information Concerning: A Study of NRA and Related Experiences in Control
Distribution, Manufacturers' Control of: Trade Practice Provisions in Selected NRA Codes
Distributive Relations in the Asbestos Industry
Design Piracy: The Problem and Its Treatment Under NRA Codes
Electrical Mfg. Industry: Price Filing Study
Fertilizer Industry: Price Filing Study
Geographical Price Relations Under Codes of Fair Competition, Control of
Minimum Price Regulation Under Codes of Fair Competition
Multiple Basing Point System in the Lime Industry: Operation of the
Price Control in the Coffee Industry
Price Filing Under NRA Codes
Production Control in the Ice Industry
Production Control, Case Studies in
Resale Price Maintenance Legislation in the United States
Retail Price Cutting, Restriction of, with special Emphasis on The Drug Industry.
Trade Practice Rules of The Federal Trade Commission (1914-1936): A classification for
comparison with Trade Practice Provisions of NRA Codes.

Labor Studies

Cap and Cloth Hat Industry, Commission Report on Wage Differentials in
Earnings in Selected Manufacturing Industries, by States, 1933-35
Employment, Payrolls, Hours, and Wages in 115 Selected Code Industries 1933-35
Fur Manufacturing, Commission Report on Wages and Hours in
Hours and Wages in American Industry
Labor Program Under the National Industrial Recovery Act, The
Part A. Introduction
Part B. Control of Hours and Reemployment
Part C. Control of Wages
Part D. Control of Other Conditions of Employment
Part E. Section 7(a) of the Recovery Act
Materials in the Field of Industrial Relations
PRA Census of Employment, June, October, 1933
Puerto Rico Needlework, Homeworkers Survey

Administrative Studies

Administrative and Legal Aspects of Stays, Exemptions and Exceptions, Code Amendments, Con-
ditional Orders of Approval
Administrative Interpretations of NRA Codes
Administrative Law and Procedure under the NIRA
Agreements Under Sections 4(a) and 7(b) of the NIRA
Approved Codes in Industry Groups, Classification of
Basic Code, the -- (Administrative Order X-61)
Code Authorities and Their part in the Administration of the NIRA
Part A. Introduction
Part B. Nature, Composition and Organization of Code Authorities
9768--3.

Part C. Activities of the Code Authorities
Part D. Code Authority Finances
Part E. Summary and Evaluation
Code Compliance Activities of the NRA
Code Making Program of the NRA in the Territories, The
Code Provisions and Related Subjects, Policy Statements Concerning
Content of NIRA Administrative Legislation
Part A. Executive and Administrative Orders
Part B. Labor Provisions in the Codes
Part C. Trade Practice Provisions in the Codes
Part D. Administrative Provisions in the Codes
Part E. Agreements under Sections 4(a) and 7(b)
Part F. A Type Case: The Cotton Textile Code
Labels Under NRA, A Study of
Model Code and Model Provisions for Codes, Development of
National Recovery Administration, The: A Review of its Organization and Activities
NRA Insignia
President's Reemployment Agreement, The
President's Reemployment Agreement, Substitutions in Connection with the
Prison Labor Problem under NRA and the Prison Compact, The
Problems of Administration in the Overlapping of Code Definitions of Industries and Trades,
Multiple Code Coverage, Classifying Individual Members of Industries and Trades
Relationship of NRA to Government Contracts and Contracts Involving the Use of Government
Funds
Relationship of NRA with States and Municipalities
Sheltered Workshops Under NRA
Uncodified Industries: A Study of Factors Limiting the Code Making Program

Legal Studies

Anti-Trust Laws and Unfair Competition
Collective Bargaining Agreements, the Right of Individual Employees to Enforce
Commerce Clause, Federal Regulation of the Employer-Employee Relationship Under the
Delegation of Power, Certain Phases of the Principle of, with Reference to Federal Industrial
Regulatory Legislation
Enforcement, Extra-Judicial Methods of
Federal Regulation through the Joint Employment of the Power of Taxation and the Spending
Power
Government Contract Provisions as a Means of Establishing Proper Economic Standards, Legal
Memorandum on Possibility of
Industrial Relations in Australia, Regulation of
Intrastate Activities Which so Affect Interstate Commerce as to Bring them Under the Com-
merce Clause, Cases on
Legislative Possibilities of the State Constitutions
Post Office and Post Road Power -- Can it be Used as a Means of Federal Industrial Regula-
tion?
State Recovery Legislation in Aid of Federal Recovery Legislation History and Analysis
Tariff Rates to Secure Proper Standards of Wages and Hours, the Possibility of Variation in
Trade Practices and the Anti-Trust Laws
Treaty Making Power of the United States
War Power, Can it be Used as a Means of Federal Regulation of Child Labor?
9768--4.

THE EVIDENCE STUDIES SERIES

The Evidence Studies were originally undertaken to gather material for pending court cases. After the Schechter decision the project was continued in order to assemble data for use in connection with the studies of the Division of Review. The data are particularly concerned with the nature, size and operations of the industry; and with the relation of the industry to interstate commerce. The industries covered by the Evidence Studies account for more than one-half of the total number of workers under codes. The list of those studies follows:

Automobile Manufacturing Industry	Leather Industry
Automotive Parts and Equipment Industry	Lumber and Timber Products Industry
Baking Industry	Mason Contractors Industry
Boot and Shoe Manufacturing Industry	Men's Clothing Industry
Bottled Soft Drink Industry	Motion Picture Industry
Builders' Supplies Industry	Motor Vehicle Retailing Trade
Canning Industry	Needlework Industry of Puerto Rico
Chemical Manufacturing Industry	Painting and Paperhanging Industry
Cigar Manufacturing Industry	Photo Engraving Industry
Coat and Suit Industry	Plumbing Contracting Industry
Construction Industry	Retail Lumber Industry
Cotton Garment Industry	Retail Trade Industry
Dress Manufacturing Industry	Retail Tire and Battery Trade Industry
Electrical Contracting Industry	Rubber Manufacturing Industry
Electrical Manufacturing Industry	Rubber Tire Manufacturing Industry
Fabricated Metal Products Mfg. and Metal Fin- ishing and Metal Coating Industry	Shipbuilding Industry
Fishery Industry	Silk Textile Industry
Furniture Manufacturing Industry	Structural Clay Products Industry
General Contractors Industry	Throwing Industry
Graphic Arts Industry	Trucking Industry
Gray Iron Foundry Industry	Waste Materials Industry
Hosiery Industry	Wholesale and Retail Food Industry
Infant's and Children's Wear Industry	Wholesale Fresh Fruit and Vegetable Indus- try
Iron and Steel Industry	Wool Textile Industry

THE STATISTICAL MATERIALS SERIES

This series is supplementary to the Evidence Studies Series. The reports include data on establishments, firms, employment, payrolls, wages, hours, production capacities, shipments, sales, consumption, stocks, prices, material costs, failures, exports and imports. They also include notes on the principal qualifications that should be observed in using the data, the technical methods employed, and the applicability of the material to the study of the industries concerned. The following numbers appear in the series:

9768—5.

Asphalt Shingle and Roofing Industry	Fertilizer Industry
Business Furniture	Funeral Supply Industry
Candy Manufacturing Industry	Glass Container Industry
Carpet and Rug Industry	Ice Manufacturing Industry
Cement Industry	Knitted Outerwear Industry
Cleaning and Dyeing Trade	Paint, Varnish, and Lacquer, Mfg. Industry
Coffee Industry	Plumbing Fixtures Industry
Copper and Brass Mill Products Industry	Rayon and Synthetic Yarn Producing Industry
Cotton Textile Industry	Salt Producing Industry
Electrical Manufacturing Industry	

THE COVERAGE

The original, and approved, plan of the Division of Review contemplated resources sufficient (a) to prepare some 1200 histories of codes and NRA units or agencies, (b) to consolidate and index the NRA files containing some 40,000,000 pieces, (c) to engage in extensive field work, (d) to secure much aid from established statistical agencies of government, (e) to assemble a considerable number of experts in various fields, (f) to conduct approximately 25% more studies than are listed above, and (g) to prepare a comprehensive summary report.

Because of reductions made in personnel and in use of outside experts, limitation of access to field work and research agencies, and lack of jurisdiction over files, the projected plan was necessarily curtailed. The most serious curtailments were the omission of the comprehensive summary report; the dropping of certain studies and the reduction in the coverage of other studies; and the abandonment of the consolidation and indexing of the files. Fortunately, there is reason to hope that the files may yet be cared for under other auspices.

Notwithstanding these limitations, if the files are ultimately consolidated and indexed the exploration of the NRA materials will have been sufficient to make them accessible and highly useful. They constitute the largest and richest single body of information concerning the problems and operations of industry ever assembled in any nation.

L. C. Marshall,
Director, Division of Review.
